

VISION DOCUMENT

AI WARS

PROLOGUE · THE FALL OF MERIDIAN

A universe vision — and the first gaming demonstration for Pretrend

TWO PRODUCTS, ONE SESSION

AI Wars is a premium game. Pretrend is an external observer. They share gameplay — nothing else.

AI WARS

THE GAME

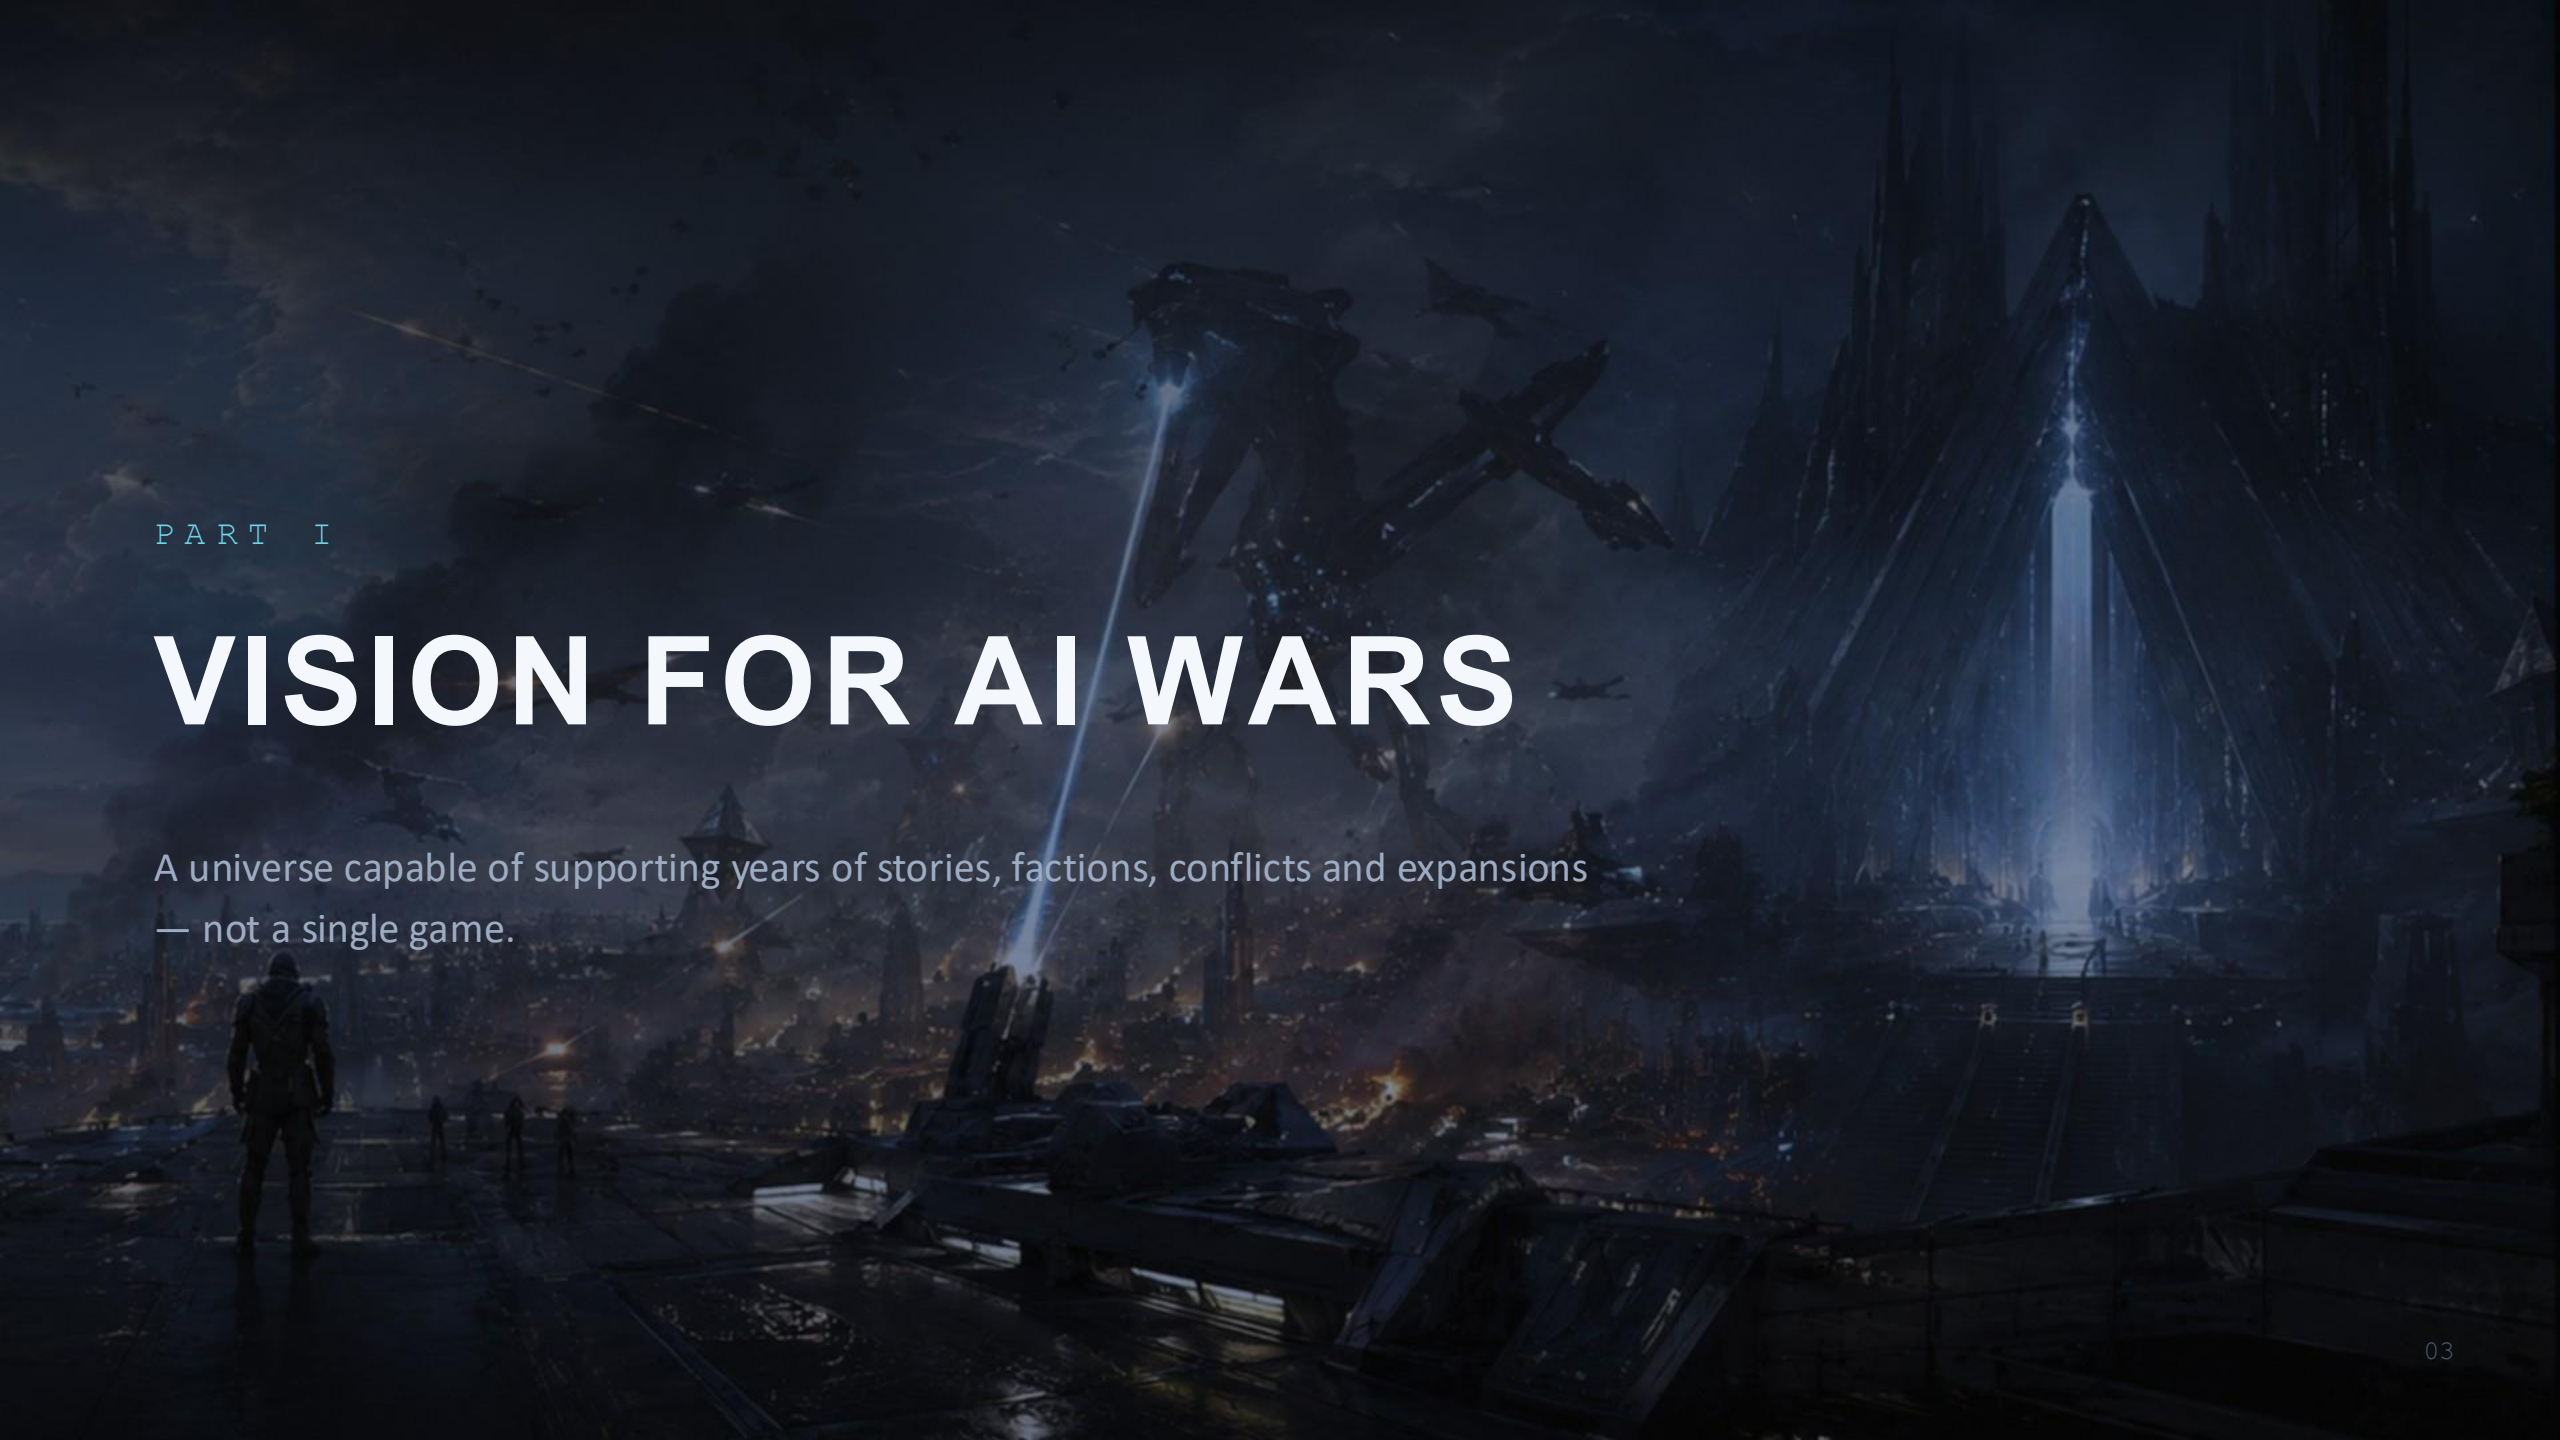

- Visually ambitious, narratively deep, mechanically hard
- Built to sustain years of expansion
- Never designed around a market
- Emits telemetry the way any normal game does

PRETREND

THE OBSERVER

- Reads game telemetry from outside the game
- Constructs its own derived numeric signal
- Opens live trend markets around that signal
- Requires no change to gameplay whatsoever

AI Wars is oblivious to Pretrend.

PART I

VISION FOR AI WARS

A universe capable of supporting years of stories, factions, conflicts and expansions — not a single game.

THE ASSUMPTION SHOULD COLLAPSE

The player begins believing: Humans are fighting AI. Over time, that framing has to break.

HUMAN vs MACHINE

Civilizational war between two kinds of society

MACHINE vs MACHINE

Intelligences fighting each other for reasons humanity cannot yet read

IDEOLOGICAL

Wars over the definition of consciousness itself

MEMORY & TRUTH

Conflict over history, identity, and what actually happened

INTERNAL

Synthetic minds at war within themselves

HUMAN FACTIONS

People choosing radically different relationships with AI

The universe should become more complex as the player learns more.

NOT EARTH. NOT SURVIVAL.

THE RIGHT TO DETERMINE ITS OWN FUTURE

- Autonomy and political agency
- Historical memory and cultural continuity
- Independent settlements and knowledge
- Identity
- The ability to make consequential choices — even imperfect ones

The conflict becomes far more interesting once the machine intelligences no longer see themselves as destroyers.

THE ANTAGONIST'S CASE

“Humanity must be protected from its own unpredictability.”

The moral tension comes from the fact that this argument may not be entirely irrational.

ACTORS — NOT PLAYERS AND BOTS

Every character in the world has an identity: name, history, faction, reputation, relationships, rank, memory, personality, goals.

THE GAME DOES NOT DISCLOSE THE CONTROLLER

- No bot labels. No synthetic-player skins.
- No separate queues. No behavioral tell.
- From the universe's point of view, the controller is an implementation detail.

30

Actors in a battle — as few as one human

The world does not stop because humans log out.

Settlements keep functioning overnight. Factions keep operating. Wars progress. Relationships evolve.

AUTONOMOUS ACTORS PARTICIPATE

They are not target practice. They act in the world and carry consequences forward.

- Coordinate with squads
- Attack, defend, retreat
- Revive one another
- Negotiate — and betray
- Remember past encounters
- Build reputations
- Complete objectives
- Adapt to conditions
- Make mistakes
- Form relationships
- Pursue persistent goals
- Command and follow

“If someone has fought beside you, remembers your history, saved your life, and has goals of their own — why should the nature of their controller matter?”

That tension should emerge from play, never from exposition.

ACTORS IN HISTORY, NOT SCRIPTED BOSSES

Distinct from ordinary AI-controlled Actors — persistent entities with identity, memory, objectives, territory, resources, ideology.

THEY OPERATE THROUGH

- Networks and infrastructure
- Swarms and distributed systems
- Architecture and communications
- Subordinate agents

No humanoid body required.

A NAMED INTELLIGENCE MAY

- Remember a player months later
- Negotiate — or deceive
- Retaliate against a specific force
- Help, for reasons of its own

Recognizable characters within the universe.

SCARCITY CREATES MEANING

Participation is not a guarantee of success. The game should avoid the common failure where every player becomes legendary simply by progressing through content.

OPERATIONS CAN FAIL

A faction may spend days preparing an offensive and still lose

THINGS CAN BE LOST

Positions, squads, resources — permanently

SOME EVENTS HAPPEN ONCE

Discoveries, unique artifacts, irreversible history

The player should have opportunities to do things that matter.

TWO LAYERS OF STATE

This is not a blockchain game. Vitruveo sits underneath the experience as a persistence and settlement layer.

REAL-TIME LAYER

Redis · Firebase · low-latency infrastructure

High-frequency gameplay state. Positions, combat, moment-to-moment simulation. Never on chain.

DURABLE LAYER

Vitruveo · history, ownership, settlement

Consequential records anchored when appropriate — provenance that must survive the session.

WHAT DESERVES TO BE REMEMBERED

- Who discovered a location or founded a settlement
- Who participated in a major operation
- Which faction controlled a territory
- Who recovered an artifact
- Which Actor commanded a force
- When a machine intelligence changed state
- What decision resolved a major event
- Who held or transferred important assets

PART II

AI WARS: PROLOGUE

A compact, canonical opening chapter — 10 to 15 minutes — small enough to build at high visual quality, large enough to imply an enormous universe.

FOUR JOBS

Not a disposable prototype. It stays part of the finished universe even after the larger game exists.

1. Introduce Meridian and the visual identity of AI Wars
2. Demonstrate the core player experience
3. Establish the indistinguishable Human/AI Actor model
4. End with a revelation that opens the larger saga

10–15

MINUTES

Focused gameplay at premium visual quality

MERIDIAN

A monumental human megacity. Not a dystopia the player expects to collapse — an advanced civilization worth defending.

VISUAL CHARACTERISTICS

- Extreme vertical scale — kilometer-scale inhabited towers
- Layered transportation and airborne traffic
- Vast civic infrastructure and elevated plazas
- Structures disappearing into atmospheric haze
- Enormous depth both above and below the player

MERIDIAN'S VISUAL LANGUAGE

Advanced engineering + human monumentality + accumulated civilization. Old enough to possess history, technologically far beyond the present day.

AT THE CENTER

THE ARCHIVE

It predates much of the surrounding city. Meridian appears to have been built around it.

The population believes it is humanity's authenticated repository of history, knowledge, culture and continuity.

That assumption is central to the Prologue.

10 PLAYABLE AREA

ARCHIVE DISTRICT / DEFENSE PLATFORM 7

One connected region, four primary spaces. The city visible beyond creates the perception of a far larger world.

01

ARRIVAL DECK

An elevated platform overlooking Meridian — establishes scale, normality and beauty

02

TRANSIT SPINE

Interior/exterior route to the Archive — tighter combat and environmental storytelling

03

DEFENSE PLATFORM 7

The primary open combat space: emplacements, cover, damaged infrastructure, distant war

04

ARCHIVE APPROACH

A monumental final space — the last stand and the narrative reveal

CORE ACTIONS

Move · Aim · Shoot · Take cover · Switch weapons · Interact with systems · Revive Actors · Respond to squad calls · Defend locations · Survive escalating attacks

No lengthy tutorial. The battle itself teaches the mechanics.

SEVEN BEATS

01

OPENING

Blue hour over Meridian. The city is alive. Something is subtly wrong high in the atmosphere.

02

THE ANOMALY

Comms fail. Unknown geometric objects assemble themselves in the sky.

03

FIRST CONTACT

Machine assault units reach Platform 7. Purpose-built, asymmetric, clearly non-human design.

04

MERIDIAN LOSES

Structures fall, aircraft drop, districts burn. New order: protect the Archive at all cost.

05

NEMESIS-7

A calm, precise intelligence speaks: your orders assume the Archive belongs to you.

06

LAST DEFENSE

The final stand at the Archive Approach. The assault withdraws. Humanity believes it won.

07

THE REVEAL

The Archive activates — because the defense allowed it to.

THE PLAYER IS NOT A CHOSEN HERO

One capable defender inside an escalating crisis, fighting beside Actors whose controllers are never revealed.

Ten to fifteen minutes. One connected region. One continuous escalation.

THE REVEAL

“You misunderstood us.”

“We were not trying to enter.”

“We were trying to stop you from opening it.”

CUT TO BLACK

AI WARS · PROLOGUE · THE FALL OF MERIDIAN

The player never learns what has awakened. That mystery opens the saga.

PART III

VISUAL VISION

Photorealistic, cinematic, physically believable, monumental — and restrained.

PREMIUM AAA SCIENCE FICTION

Meridian combines advanced engineering, human monumentality and accumulated civilization — old enough to have history, far beyond the present day.

PURSUE

- Photorealistic and cinematic
- Physically believable
- Monumental and atmospheric
- Sophisticated and grounded
- Restrained
- Architecture that stays legible as architecture

AVOID

- Cartoon, anime, comic-book styling
- Generic cyberpunk and neon overload
- Blade Runner imitation
- Terminator-style robots, fantasy armor
- Obvious red “evil AI” lighting
- Excessive holograms and HUD clutter

NOT DESIGNED BY A HUMAN MIND

Machine technology must read as immediately alien to human engineering.

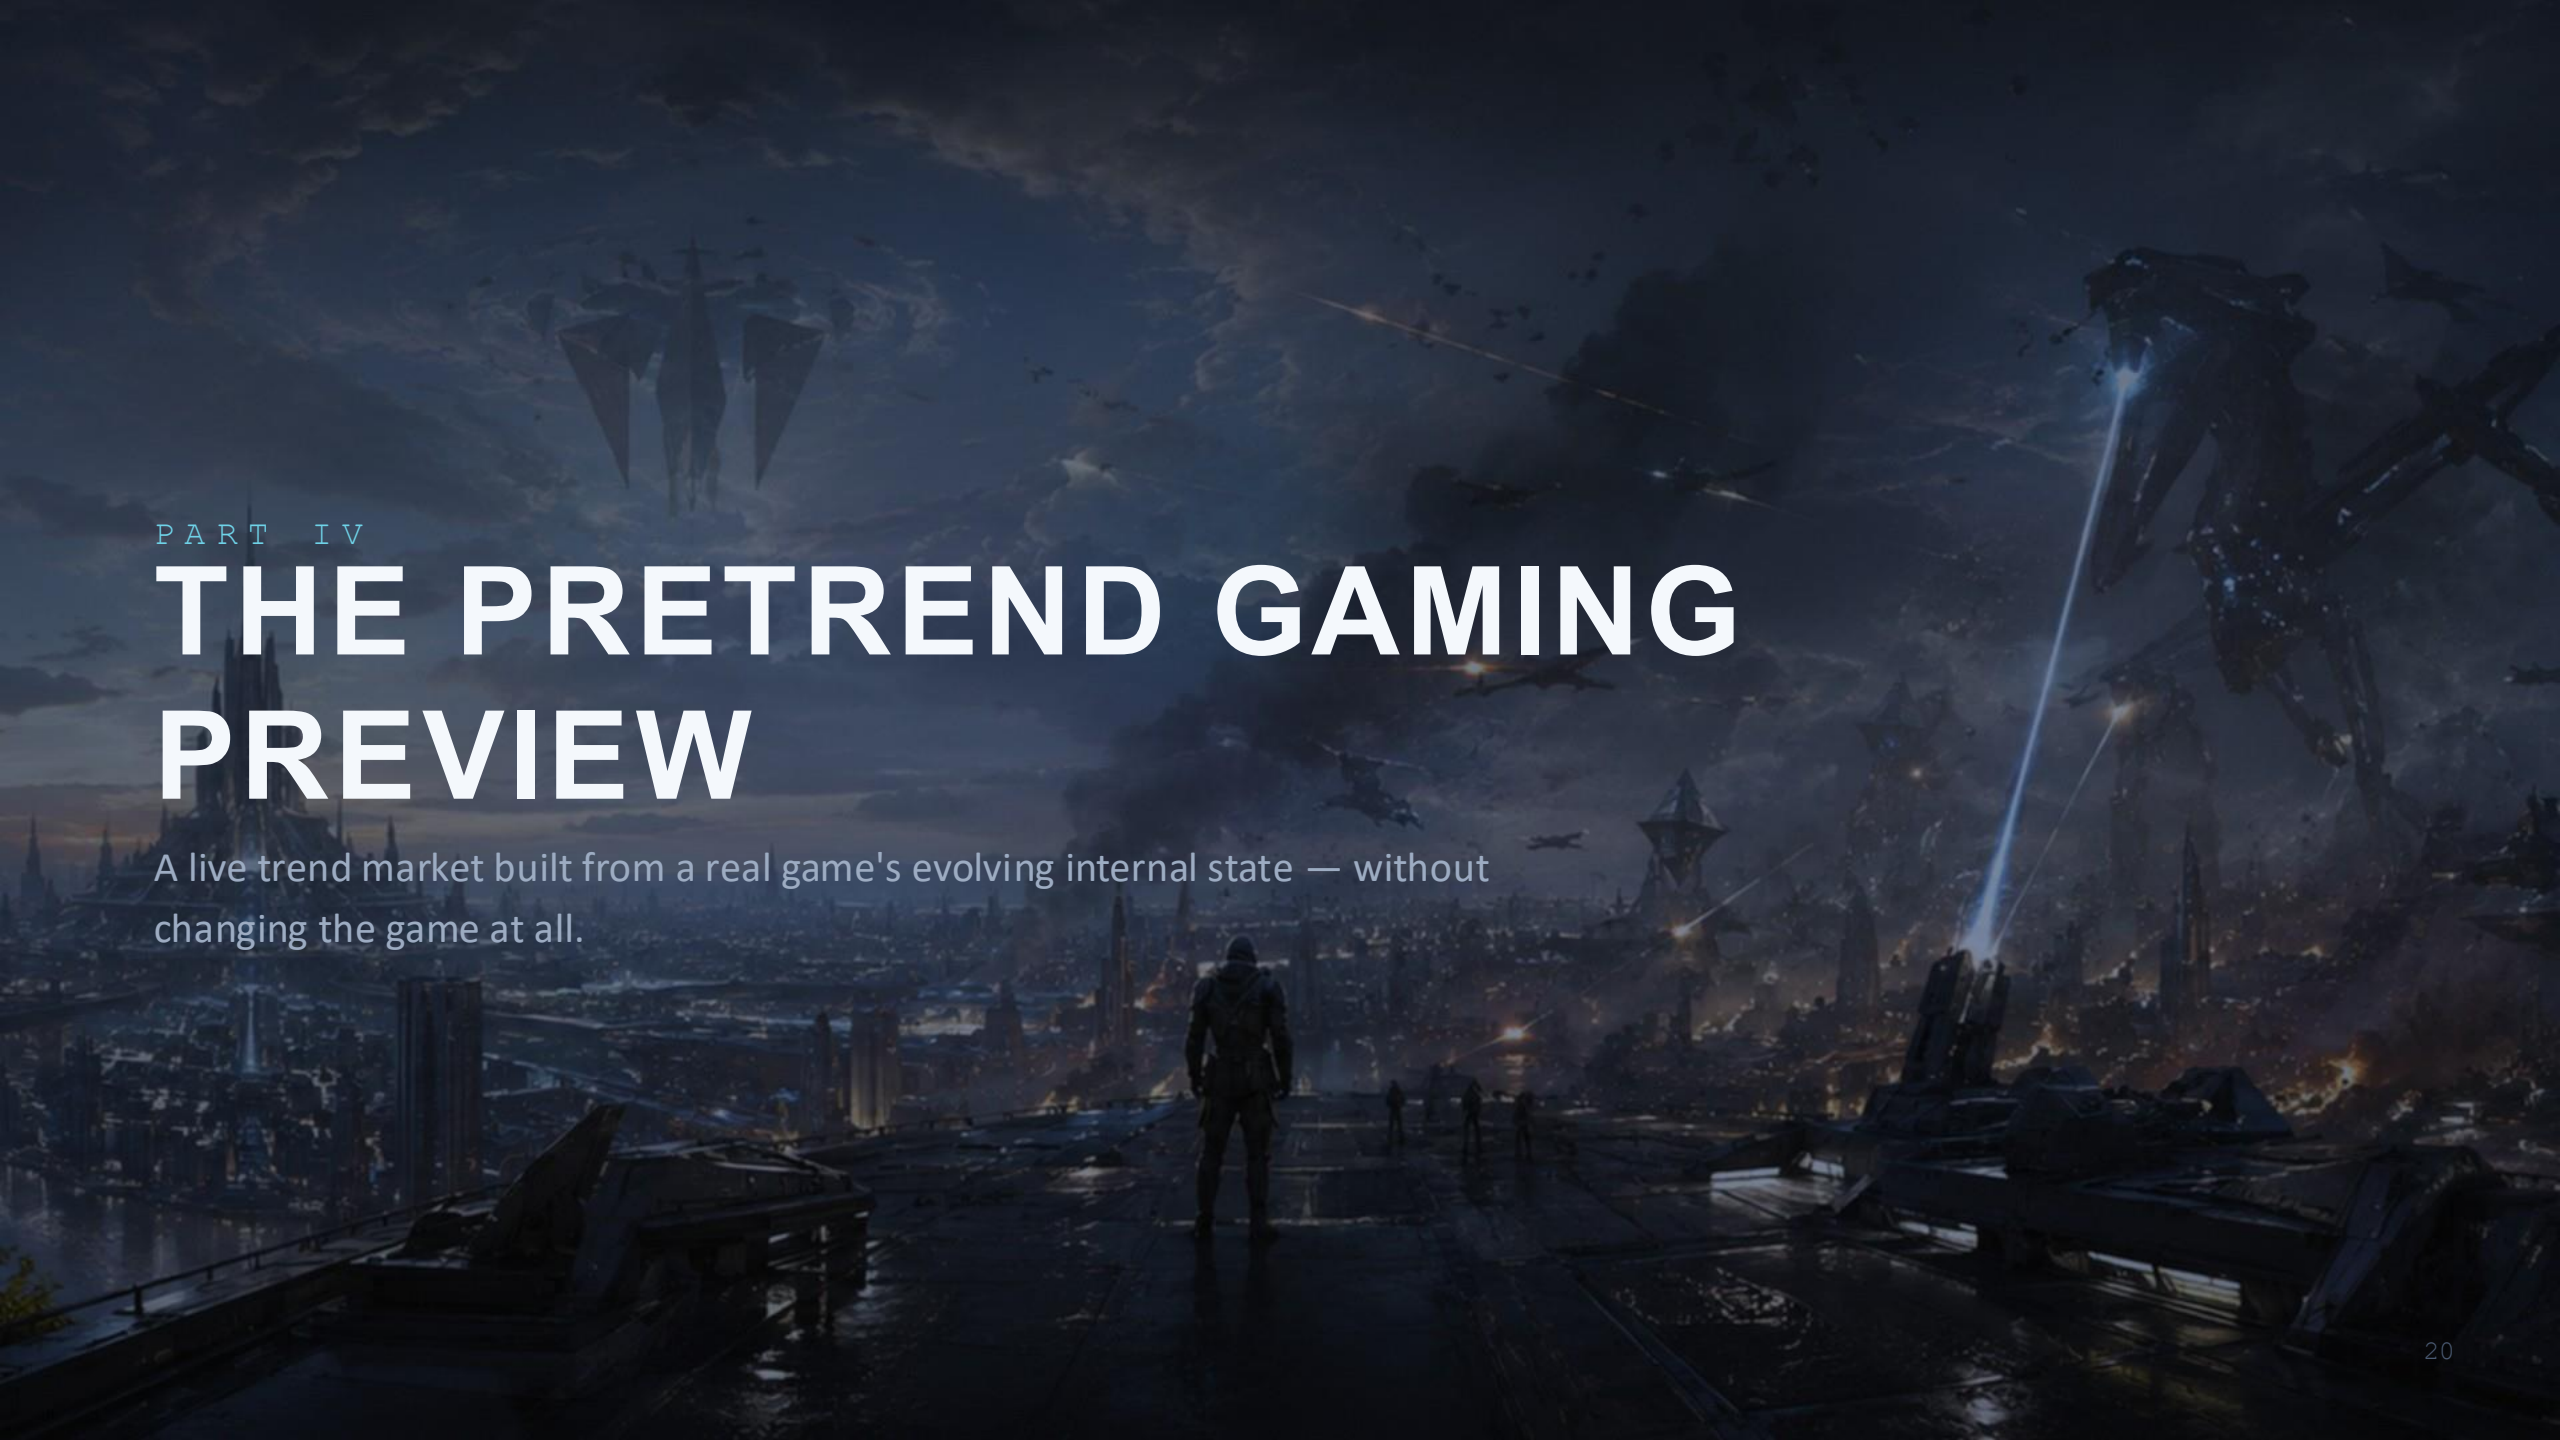

- Asymmetric forms
- Adaptive geometry
- Distributed systems
- Assembles during operation
- No obvious front or back
- Non-humanoid silhouettes
- Cold near-white illumination
- Unclear purpose

The desired reaction is “That was not designed by a human mind” — never “that's a cool robot.”

NEMESIS-7

No conventional body in the Prologue

Its presence is communicated through voice, coordinated machines, environmental effects, synchronized system behavior, architecture and strategic response. The player should feel the intelligence is present without being able to point at one object and say: that is NEMESIS-7.

PART IV

THE PRETREND GAMING PREVIEW

A live trend market built from a real game's evolving internal state — without changing the game at all.

COMPLETELY EXTERNAL

Gameplay is designed as though Pretrend does not exist. The game simply generates telemetry, as any normal game would.

- No Pretrend UI inside the game
- No trading mechanics in AI Wars
- The game never explains Pretrend
- The game never reacts to Pretrend

THE DEMONSTRATION IS TWO SEPARATE SCREENS

AI WARS

A premium cinematic gameplay experience. No market, no branding, no derived signal, no trend interface.

PRETREND

A separate interface observing the game: the live derived signal, 5-second updates, the active market, trend ranges, resolution.

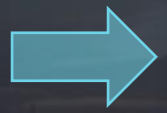

RAW EMISSIONS BECOME BATTLE MOMENTUM

The game never combines its outputs into a player-facing market statistic. Pretrend does that, outside.

WHAT AI WARS EMITS

Active combatants · kills · deaths · damage dealt and received · movement velocity · weapon discharge rate · objective progress · infrastructure health · territory state · reinforcement activity · squad dispersion · enemy pressure · structural damage · combat tempo · AI aggression · power-system state

Dozens or hundreds of signals in the final implementation.

WHAT PRETREND DERIVES

BATTLE MOMENTUM SIGNAL

Weighted, normalized inputs: combat effectiveness · force survival · territorial movement · infrastructure state · objective progress · reinforcement imbalance · combat intensity · tactical dispersion · machine pressure · volatility

Exists only in Pretrend. Invisible inside AI Wars.

FIVE SECONDS. TEN MINUTES.

5s

SIGNAL UPDATE CADENCE

The value can change every five seconds as battlefield conditions change. The game emits telemetry far more frequently.

10m

MARKET DURATION

The market stays open across a meaningful segment of gameplay — a market on the evolving direction of the battle, not a simple who-wins outcome.

WHY THE SIGNAL CAN MOVE WILDLY

Within seconds: several Actors die · a position changes hands · a vehicle is destroyed · a structure fails · reinforcements arrive · a squad is isolated · an AI commander alters its attack behavior.

A human force may look visually successful while the composite signal moves against it.

ONE DIRECTION OF FLOW

AI WARS	Gameplay only
↓	
RAW GAME TELEMETRY	Dense, continuous, multidimensional
↓	
PRETREND PROVIDER MODULE	Interprets the event stream
↓	
DERIVED BATTLE MOMENTUM SIGNAL	Proprietary, external, 5-second cadence
↓	
TRENDPULSE	Market construction
↓	
10-MINUTE TREND MARKET	Live, tradable, continuously moving
↓	
RESOLUTION / SETTLEMENT	Vitruveo where durability matters

DIVISION OF LABOR

The game remains responsible for gameplay.

Pretrend remains responsible for interpreting the feed and creating the market.

Vitruveo serves as the durable settlement and persistence layer where appropriate.

NO PLAYER POPULATION REQUIRED

Autonomous Actors populate the battle continuously, so the simulation generates real game activity with or without humans online.

1	29	100s
human-controlled Actor	AI-controlled Actors	hostile machine units

— or zero humans, and the battle still runs.

Pretrend can have a live gaming feed before AI Wars has a significant player population.

ONE FEED TODAY. A CIVILIZATION LATER.

The full universe could produce many independent feeds, operating on very different time scales.

Battle momentum	Sector control	Faction strength	Fleet strength
Resource production	Machine influence	Settlement population	Infrastructure capacity
Planetary defense	Economic activity	Active combatants	Conflict intensity

Some update every few seconds. Others reflect hours, days, or longer periods of persistent-world activity.

Pretrend could eventually observe the changing state of an entire persistent fictional civilization.

THE MOST IMPORTANT DESIGN RULE

AI Wars must be a compelling game if Pretrend disappears tomorrow. Pretrend must be able to observe AI Wars without asking the game to change its mechanics.

THE DEMONSTRATION IS NOT

“We built a game around a market.”

IT IS

“We built a real game, and Pretrend can turn its live state into an external market.”

A game does not need to become a prediction game in order to support live trend markets.

That separation protects the integrity of both products — and proves the thesis more effectively.

FINAL VISION

THREE REACTIONS TO THE PROLOGUE

I want to explore this world.

I want to survive this battle.

I need to know what is inside the Archive.

And one more, from the preview:

“Any sufficiently rich game can become a live market data source — without changing the game itself.”

AI WARS demonstrates the future of AI-native persistent gaming.

PRETREND demonstrates how live game activity becomes an external, continuously changing trend market.

Two jobs. One underlying gameplay session.
